# FullyConnectedNets

October 29, 2021

### 1 Fully-Connected Neural Nets

In the previous homework you implemented a fully-connected two-layer neural network on CIFAR-10. The implementation was simple but not very modular since the loss and gradient were computed in a single monolithic function. This is manageable for a simple two-layer network, but would become impractical as we move to bigger models. Ideally we want to build networks using a more modular design so that we can implement different layer types in isolation and then snap them together into models with different architectures.

In this exercise we will implement fully-connected networks using a more modular approach. For each layer we will implement a forward and a backward function. The forward function will receive inputs, weights, and other parameters and will return both an output and a cache object storing data needed for the backward pass, like this:

```
def layer_forward(x, w):
    """ Receive inputs x and weights w """
    # Do some computations ...
    z = # ... some intermediate value
    # Do some more computations ...
    out = # the output

cache = (x, w, z, out) # Values we need to compute gradients
    return out, cache
```

The backward pass will receive upstream derivatives and the cache object, and will return gradients with respect to the inputs and weights, like this:

```
def layer_backward(dout, cache):
    """
    Receive dout (derivative of loss with respect to outputs) and cache,
    and compute derivative with respect to inputs.
    """
    # Unpack cache values
    x, w, z, out = cache

# Use values in cache to compute derivatives
    dx = # Derivative of loss with respect to x
    dw = # Derivative of loss with respect to w
```

```
return dx, dw
```

('y\_val: ', (1000,))

('y\_test: ', (1000,))

('X\_test: ', (1000, 3, 32, 32))

After implementing a bunch of layers this way, we will be able to easily combine them to build classifiers with different architectures.

In addition to implementing fully-connected networks of arbitrary depth, we will also explore different update rules for optimization, and introduce Dropout as a regularizer and Batch/Layer Normalization as a tool to more efficiently optimize deep networks.

```
[1]: # As usual, a bit of setup
     from future import print function
     import time
     import numpy as np
     import matplotlib.pyplot as plt
     from cs682.classifiers.fc_net import *
     from cs682.data_utils import get_CIFAR10_data
     from cs682.gradient_check import eval_numerical_gradient,_
      →eval_numerical_gradient_array
     from cs682.solver import Solver
     %matplotlib inline
     plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
     plt.rcParams['image.interpolation'] = 'nearest'
     plt.rcParams['image.cmap'] = 'gray'
     # for auto-reloading external modules
     # see http://stackoverflow.com/questions/1907993/
     \rightarrow autoreload-of-modules-in-ipython
     %load ext autoreload
     %autoreload 2
     def rel error(x, y):
       """ returns relative error """
       return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

```
[2]: # Load the (preprocessed) CIFAR10 data.

data = get_CIFAR10_data()
   for k, v in list(data.items()):
        print(('%s: ' % k, v.shape))

('X_train: ', (49000, 3, 32, 32))
        ('y_train: ', (49000,))
        ('X_val: ', (1000, 3, 32, 32))
```

### 2 Affine layer: foward

Open the file cs682/layers.py and implement the affine\_forward function.

Once you are done you can test your implementation by running the following:

```
[3]: # Test the affine_forward function
     num_inputs = 2
     input\_shape = (4, 5, 6)
     output_dim = 3
     input_size = num_inputs * np.prod(input_shape)
     weight_size = output_dim * np.prod(input_shape)
     x = np.linspace(-0.1, 0.5, num=input_size).reshape(num_inputs, *input_shape)
     w = np.linspace(-0.2, 0.3, num=weight_size).reshape(np.prod(input_shape),_
     →output_dim)
     b = np.linspace(-0.3, 0.1, num=output dim)
     out, _ = affine_forward(x, w, b)
     correct_out = np.array([[ 1.49834967, 1.70660132, 1.91485297],
                             [ 3.25553199, 3.5141327, 3.77273342]])
     # Compare your output with ours. The error should be around e-9 or less.
     print('Testing affine_forward function:')
     print('difference: ', rel_error(out, correct_out))
```

Testing affine\_forward function: difference: 9.769847728806635e-10

## 3 Affine layer: backward

Now implement the affine\_backward function and test your implementation using numeric gradient checking.

```
[4]: # Test the affine_backward function
np.random.seed(231)
x = np.random.randn(10, 2, 3)
w = np.random.randn(6, 5)
b = np.random.randn(5)
dout = np.random.randn(10, 5)

dx_num = eval_numerical_gradient_array(lambda x: affine_forward(x, w, b)[0], x,u
dout)
dw_num = eval_numerical_gradient_array(lambda w: affine_forward(x, w, b)[0], w,u
dout)
```

```
db_num = eval_numerical_gradient_array(lambda b: affine_forward(x, w, b)[0], b,u
dout)

_, cache = affine_forward(x, w, b)
dx, dw, db = affine_backward(dout, cache)

# The error should be around e-10 or less
print('Testing affine_backward function:')
print('dx error: ', rel_error(dx_num, dx))
print('dw error: ', rel_error(dw_num, dw))
print('db error: ', rel_error(db_num, db))
```

Testing affine\_backward function: dx error: 5.399100368651805e-11 dw error: 9.904211865398145e-11 db error: 2.4122867568119087e-11

### 4 ReLU activation: forward

Implement the forward pass for the ReLU activation function in the relu\_forward function and test your implementation using the following:

Testing relu\_forward function: difference: 4.999999798022158e-08

### 5 ReLU activation: backward

Now implement the backward pass for the ReLU activation function in the relu\_backward function and test your implementation using numeric gradient checking:

```
[6]: np.random.seed(231)
x = np.random.randn(10, 10)
dout = np.random.randn(*x.shape)
```

```
dx_num = eval_numerical_gradient_array(lambda x: relu_forward(x)[0], x, dout)

_, cache = relu_forward(x)
dx = relu_backward(dout, cache)

# The error should be on the order of e-12
print('Testing relu_backward function:')
print('dx error: ', rel_error(dx_num, dx))
```

Testing relu\_backward function: dx error: 3.2756349136310288e-12

### 5.1 Inline Question 1:

We've only asked you to implement ReLU, but there are a number of different activation functions that one could use in neural networks, each with its pros and cons. In particular, an issue commonly seen with activation functions is getting zero (or close to zero) gradient flow during backpropagation. Which of the following activation functions have this problem? If you consider these functions in the one dimensional case, what types of input would lead to this behaviour? 1. Sigmoid 2. ReLU 3. Leaky ReLU

#### 5.2 Answer:

[FILL THIS IN]

Both Sigmoid and ReLu would cause this issue 1. Sigmoid-> When the score is too big or too small

- 2. ReLU-> When the score is less than or equal to 0
- 3. Leaky ReLU-> Will not "die"

## 6 "Sandwich" layers

There are some common patterns of layers that are frequently used in neural nets. For example, affine layers are frequently followed by a ReLU nonlinearity. To make these common patterns easy, we define several convenience layers in the file cs682/layer\_utils.py.

For now take a look at the affine\_relu\_forward and affine\_relu\_backward functions, and run the following to numerically gradient check the backward pass:

```
[7]: from cs682.layer_utils import affine_relu_forward, affine_relu_backward
    np.random.seed(231)
    x = np.random.randn(2, 3, 4)
    w = np.random.randn(12, 10)
    b = np.random.randn(10)
    dout = np.random.randn(2, 10)

out, cache = affine_relu_forward(x, w, b)
    dx, dw, db = affine_relu_backward(dout, cache)
```

Testing affine\_relu\_forward and affine\_relu\_backward:

dx error: 6.750562121603446e-11
dw error: 8.162015570444288e-11
db error: 7.826724021458994e-12

### 7 Loss layers: Softmax and SVM

You implemented these loss functions in the last assignment, so we'll give them to you for free here. You should still make sure you understand how they work by looking at the implementations in cs682/layers.py.

You can make sure that the implementations are correct by running the following:

```
[8]: np.random.seed(231)
     num_classes, num_inputs = 10, 50
     x = 0.001 * np.random.randn(num_inputs, num_classes)
     y = np.random.randint(num_classes, size=num_inputs)
     dx_num = eval_numerical_gradient(lambda x: svm_loss(x, y)[0], x, verbose=False)
     loss, dx = svm_loss(x, y)
     # Test sum loss function. Loss should be around 9 and dx error should be around
      \rightarrow the order of e-9
     print('Testing svm loss:')
     print('loss: ', loss)
     print('dx error: ', rel_error(dx_num, dx))
     dx num = eval_numerical_gradient(lambda x: softmax_loss(x, y)[0], x,__
      →verbose=False)
     loss, dx = softmax loss(x, y)
     # Test softmax loss function. Loss should be close to 2.3 and dx error should
      \rightarrow be around e-8
     print('\nTesting softmax_loss:')
```

```
print('loss: ', loss)
print('dx error: ', rel_error(dx_num, dx))

Testing svm_loss:
loss: 8.999602749096233
dx error: 1.4021566006651672e-09

Testing softmax_loss:
loss: 2.302545844500738
dx error: 9.384673161989355e-09
```

### 8 Two-layer network

In the previous assignment you implemented a two-layer neural network in a single monolithic class. Now that you have implemented modular versions of the necessary layers, you will reimplement the two layer network using these modular implementations.

Open the file cs682/classifiers/fc\_net.py and complete the implementation of the TwoLayerNet class. This class will serve as a model for the other networks you will implement in this assignment, so read through it to make sure you understand the API. You can run the cell below to test your implementation.

```
[9]: np.random.seed(231)
     N, D, H, C = 3, 5, 50, 7
     X = np.random.randn(N, D)
     y = np.random.randint(C, size=N)
     std = 1e-3
     model = TwoLayerNet(input_dim=D, hidden_dim=H, num_classes=C, weight_scale=std)
     print('Testing initialization ... ')
     W1_std = abs(model.params['W1'].std() - std)
     b1 = model.params['b1']
     W2_std = abs(model.params['W2'].std() - std)
     b2 = model.params['b2']
     assert W1 std < std / 10, 'First layer weights do not seem right'
     assert np.all(b1 == 0), 'First layer biases do not seem right'
     assert W2_std < std / 10, 'Second layer weights do not seem right'
     assert np.all(b2 == 0), 'Second layer biases do not seem right'
     print('Testing test-time forward pass ... ')
     model.params['W1'] = np.linspace(-0.7, 0.3, num=D*H).reshape(D, H)
     model.params['b1'] = np.linspace(-0.1, 0.9, num=H)
     model.params['W2'] = np.linspace(-0.3, 0.4, num=H*C).reshape(H, C)
     model.params['b2'] = np.linspace(-0.9, 0.1, num=C)
     X = np.linspace(-5.5, 4.5, num=N*D).reshape(D, N).T
     scores = model.loss(X)
     correct_scores = np.asarray(
```

```
[[11.53165108, 12.2917344, 13.05181771, 13.81190102, 14.57198434, 15.
 \rightarrow 33206765, 16.09215096],
   [12.05769098, 12.74614105, 13.43459113, 14.1230412, 14.81149128, 15.
 \rightarrow49994135, 16.18839143],

b1 relative error: 1.56e-08
b2 relative error: 7.76e-10
```

### 9 Solver

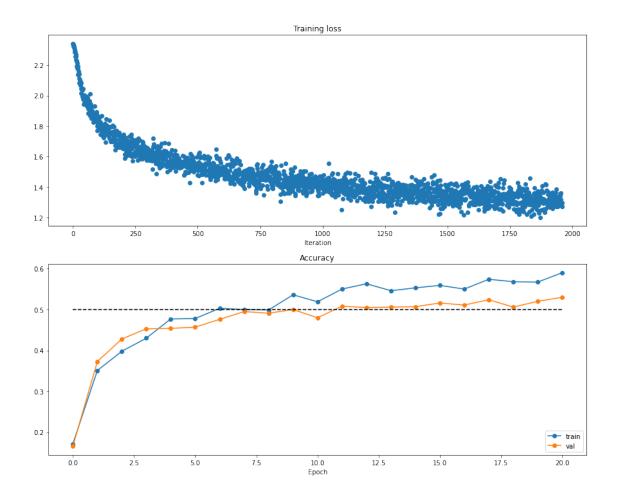

In the previous assignment, the logic for training models was coupled to the models themselves. Following a more modular design, for this assignment we have split the logic for training models into a separate class.

Open the file cs682/solver.py and read through it to familiarize yourself with the API. After doing so, use a Solver instance to train a TwoLayerNet that achieves at least 50% accuracy on the validation set.

```
[10]: model = TwoLayerNet()
   solver = None
   # TODO: Use a Solver instance to train a TwoLayerNet that achieves at least
   # 50% accuracy on the validation set.
   model = TwoLayerNet(hidden dim=100, reg=0.25)
   solver = Solver(model, data,
            update rule='sgd',
            optim_config={
             'learning_rate': 1e-3,
            },
            lr_decay=0.95,
            num_epochs=20, batch_size=500,
            print_every=300)
   solver.train()
   END OF YOUR CODE
```

```
(Iteration 1 / 1960) loss: 2.339739
(Epoch 0 / 20) train acc: 0.172000; val_acc: 0.166000
(Epoch 1 / 20) train acc: 0.351000; val_acc: 0.373000
(Epoch 2 / 20) train acc: 0.398000; val_acc: 0.428000
(Epoch 3 / 20) train acc: 0.430000; val_acc: 0.453000

(Epoch 4 / 20) train acc: 0.477000; val_acc: 0.454000
(Epoch 5 / 20) train acc: 0.478000; val_acc: 0.457000
(Epoch 6 / 20) train acc: 0.503000; val_acc: 0.476000
(Iteration 601 / 1960) loss: 1.521740
(Epoch 7 / 20) train acc: 0.500000; val_acc: 0.495000
(Epoch 8 / 20) train acc: 0.499000; val_acc: 0.491000
(Epoch 9 / 20) train acc: 0.536000; val_acc: 0.491000
(Iteration 901 / 1960) loss: 1.475126
(Epoch 10 / 20) train acc: 0.519000; val_acc: 0.480000
```

```
(Epoch 11 / 20) train acc: 0.550000; val_acc: 0.508000
     (Epoch 12 / 20) train acc: 0.563000; val_acc: 0.505000
     (Iteration 1201 / 1960) loss: 1.373529
     (Epoch 13 / 20) train acc: 0.546000; val_acc: 0.506000
     (Epoch 14 / 20) train acc: 0.553000; val acc: 0.507000
     (Epoch 15 / 20) train acc: 0.559000; val_acc: 0.516000
     (Iteration 1501 / 1960) loss: 1.395116
     (Epoch 16 / 20) train acc: 0.550000; val_acc: 0.511000
     (Epoch 17 / 20) train acc: 0.574000; val_acc: 0.524000
     (Epoch 18 / 20) train acc: 0.568000; val_acc: 0.506000
     (Iteration 1801 / 1960) loss: 1.273169
     (Epoch 19 / 20) train acc: 0.567000; val_acc: 0.520000
     (Epoch 20 / 20) train acc: 0.590000; val_acc: 0.530000
[11]: # Run this cell to visualize training loss and train / val accuracy
      plt.subplot(2, 1, 1)
      plt.title('Training loss')
      plt.plot(solver.loss_history, 'o')
      plt.xlabel('Iteration')
      plt.subplot(2, 1, 2)
      plt.title('Accuracy')
      plt.plot(solver.train_acc_history, '-o', label='train')
      plt.plot(solver.val_acc_history, '-o', label='val')
      plt.plot([0.5] * len(solver.val acc history), 'k--')
      plt.xlabel('Epoch')
      plt.legend(loc='lower right')
      plt.gcf().set_size_inches(15, 12)
      plt.show()
```

## 10 Multilayer network

Next you will implement a fully-connected network with an arbitrary number of hidden layers.

Read through the FullyConnectedNet class in the file cs682/classifiers/fc\_net.py.

Implement the initialization, the forward pass, and the backward pass. For the moment don't worry about implementing dropout or batch/layer normalization; we will add those features soon.

### 10.1 Initial loss and gradient check

As a sanity check, run the following to check the initial loss and to gradient check the network both with and without regularization. Do the initial losses seem reasonable?

For gradient checking, you should expect to see errors around 1e-7 or less.

```
[12]: np.random.seed(231)
    N, D, H1, H2, C = 2, 15, 20, 30, 10
    X = np.random.randn(N, D)
    y = np.random.randint(C, size=(N,))
```

```
Running check with reg = 0
Initial loss: 2.3004790897684924
W1 relative error: 1.48e-07
W2 relative error: 2.21e-05
W3 relative error: 3.53e-07
b1 relative error: 5.38e-09
b2 relative error: 2.09e-09
b3 relative error: 5.80e-11
Running check with reg = 3.14
Initial loss: 7.052114776533016
W1 relative error: 3.90e-09
W2 relative error: 6.87e-08
W3 relative error: 2.13e-08
b1 relative error: 1.48e-08
b2 relative error: 1.72e-09
b3 relative error: 1.57e-10
```

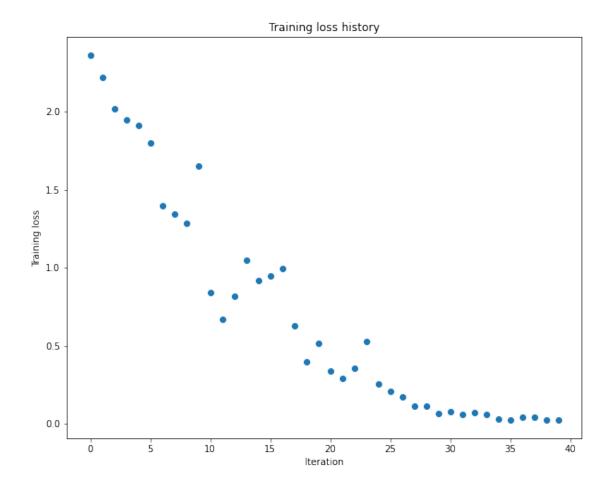

As another sanity check, make sure you can overfit a small dataset of 50 images. First we will try a three-layer network with 100 units in each hidden layer. In the following cell, tweak the learning rate and initialization scale to overfit and achieve 100% training accuracy within 20 epochs.

```
[13]: # TODO: Use a three-layer Net to overfit 50 training examples by
# tweaking just the learning rate and initialization scale.

num_train = 50
small_data = {
    'X_train': data['X_train'][:num_train],
    'y_train': data['y_train'][:num_train],
    'X_val': data['X_val'],
    'y_val': data['y_val'],
```

```
}
weight_scale = 1e-2
learning_rate = 1e-2
model = FullyConnectedNet([100, 100],
              weight_scale=weight_scale, dtype=np.float64)
solver = Solver(model, small_data,
                print_every=10, num_epochs=20, batch_size=25,
                update rule='sgd',
                optim_config={
                   'learning_rate': learning_rate,
solver.train()
plt.plot(solver.loss_history, 'o')
plt.title('Training loss history')
plt.xlabel('Iteration')
plt.ylabel('Training loss')
plt.show()
(Iteration 1 / 40) loss: 2.363364
(Epoch 0 / 20) train acc: 0.180000; val acc: 0.108000
(Epoch 1 / 20) train acc: 0.320000; val_acc: 0.127000
(Epoch 2 / 20) train acc: 0.440000; val acc: 0.172000
(Epoch 3 / 20) train acc: 0.500000; val_acc: 0.184000
(Epoch 4 / 20) train acc: 0.540000; val_acc: 0.181000
(Epoch 5 / 20) train acc: 0.740000; val_acc: 0.190000
(Iteration 11 / 40) loss: 0.839976
(Epoch 6 / 20) train acc: 0.740000; val_acc: 0.187000
(Epoch 7 / 20) train acc: 0.740000; val_acc: 0.183000
(Epoch 8 / 20) train acc: 0.820000; val_acc: 0.177000
(Epoch 9 / 20) train acc: 0.860000; val_acc: 0.200000
(Epoch 10 / 20) train acc: 0.920000; val acc: 0.191000
(Iteration 21 / 40) loss: 0.337174
(Epoch 11 / 20) train acc: 0.960000; val_acc: 0.189000
(Epoch 12 / 20) train acc: 0.940000; val_acc: 0.180000

```

(Epoch 20 / 20) train acc: 1.000000; val\_acc: 0.192000

Now try to use a five-layer network with 100 units on each layer to overfit 50 training examples. Again you will have to adjust the learning rate and weight initialization, but you should be able to achieve 100% training accuracy within 20 epochs.

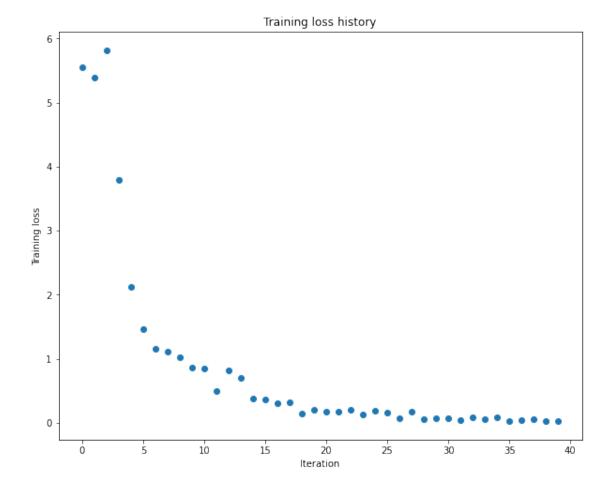

```
[14]: # TODO: Use a five-layer Net to overfit 50 training examples by
# tweaking just the learning rate and initialization scale.

num_train = 50
small_data = {
    'X_train': data['X_train'][:num_train],
    'y_train': data['y_train'][:num_train],
    'X_val': data['X_val'],
    'y_val': data['Y_val'],
}

weight_scale = 5e-2
learning_rate = 1.5e-2
model = FullyConnectedNet([100, 100, 100],
    weight_scale=weight_scale, dtype=np.float64)
```

```
solver = Solver(model, small_data,
                print_every=10, num_epochs=20, batch_size=25,
                update_rule='sgd',
                optim_config={
                   'learning_rate': learning_rate,
solver.train()
plt.plot(solver.loss_history, 'o')
plt.title('Training loss history')
plt.xlabel('Iteration')
plt.ylabel('Training loss')
plt.show()
(Iteration 1 / 40) loss: 5.557032

### 10.2 Inline Question 2:

Did you notice anything about the comparative difficulty of training the three-layer net vs training the five layer net? In particular, based on your experience, which network seemed more sensitive to the initialization scale? Why do you think that is the case?

#### 10.3 Answer:

[FILL THIS IN]

Yes, when training the five layer net, it is a lot sensitive, it is a lot harder to get the right hyperparameters. It relies heavily on the weight initialization.

# 11 Update rules

So far we have used vanilla stochastic gradient descent (SGD) as our update rule. More sophisticated update rules can make it easier to train deep networks. We will implement a few of the most commonly used update rules and compare them to vanilla SGD.

### 12 SGD+Momentum

Stochastic gradient descent with momentum is a widely used update rule that tends to make deep networks converge faster than vanilla stochastic gradient descent. See the Momentum Update section at https://compsci682-fa19.github.io/notes/neural-networks-3/#sgd for more information.

Open the file cs682/optim.py and read the documentation at the top of the file to make sure you understand the API. Implement the SGD+momentum update rule in the function sgd\_momentum and run the following to check your implementation. You should see errors less than e-8.

```
[15]: from cs682.optim import sgd_momentum
     N, D = 4, 5
     w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
     dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
     v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
     config = {'learning_rate': 1e-3, 'velocity': v}
     next_w, _ = sgd_momentum(w, dw, config=config)
     expected next w = np.asarray([
                  0.20738947, 0.27417895, 0.34096842, 0.40775789],
       [0.1406,
       [0.47454737, 0.54133684, 0.60812632, 0.67491579, 0.74170526],
       [ 0.80849474, 0.87528421, 0.94207368, 1.00886316, 1.07565263],
        [ 1.14244211, 1.20923158, 1.27602105, 1.34281053, 1.4096
                                                                      ]])
     expected_velocity = np.asarray([
       [ 0.5406,
                   0.55475789, 0.56891579, 0.58307368, 0.59723158],
       [ 0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
        [0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
        [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
                                                                      ]])
      # Should see relative errors around e-8 or less
     print('next_w error: ', rel_error(next_w, expected_next_w))
     print('velocity error: ', rel_error(expected_velocity, config['velocity']))
```

next\_w error: 8.882347033505819e-09 velocity error: 4.269287743278663e-09

Once you have done so, run the following to train a six-layer network with both SGD and SGD+momentum. You should see the SGD+momentum update rule converge faster.

```
solvers = {}
for update_rule in ['sgd', 'sgd_momentum']:
  print('running with ', update_rule)
  model = FullyConnectedNet([100, 100, 100, 100, 100], weight_scale=5e-2)
  solver = Solver(model, small_data,
                  num_epochs=5, batch_size=100,
                  update_rule=update_rule,
                   optim_config={
                     'learning_rate': 1e-2,
                  },
                  verbose=True)
  solvers[update_rule] = solver
  solver.train()
  print()

## 13 RMSProp and Adam

RMSProp [1] and Adam [2] are update rules that set per-parameter learning rates by using a running average of the second moments of gradients.

In the file cs682/optim.py, implement the RMSProp update rule in the rmsprop function and implement the Adam update rule in the adam function, and check your implementations using the tests below.

**NOTE:** Please implement the *complete* Adam update rule (with the bias correction mechanism), not the first simplified version mentioned in the course notes.

#### 13.1 Inline Question 3:

AdaGrad, like Adam, is a per-parameter optimization method that uses the following update rule:

John notices that when he was training a network with AdaGrad that the updates became very small, and that his network was learning slowly. Using your knowledge of the AdaGrad update rule, why do you think the updates would become very small? Would Adam have the same issue?

#### 13.2 Answer:

This is due to its monotonic learning rate, which leads to a too aggressive learning and stops too early.

### 14 Train a good model!

Train the best fully-connected model that you can on CIFAR-10, storing your best model in the best\_model variable. We require you to get at least 50% accuracy on the validation set using a fully-connected net.

If you are careful it should be possible to get accuracies above 55%, but we don't require it for this part and won't assign extra credit for doing so. Later in the assignment we will ask you to train the best convolutional network that you can on CIFAR-10, and we would prefer that you spend your effort working on convolutional nets rather than fully-connected nets.

You might find it useful to complete the BatchNormalization.ipynb and Dropout.ipynb notebooks before completing this part, since those techniques can help you train powerful models.

```
[20]: best_model = None
   # TODO: Train the best FullyConnectedNet that you can on CIFAR-10. You might
    # find batch/layer normalization and dropout useful. Store your best model in
    # the best model variable.
    hidden_dims = [100, 100, 100, 100, 100]
   num_train = 1000
   dropout = 0.25
   weight_scale = 2e-2
   model = FullyConnectedNet(hidden_dims, weight_scale=weight_scale,_
    →normalization='batchnorm', dropout=dropout)
   solver = Solver(model, data,
           num_epochs=10, batch_size=50,
           update_rule='adam',
            optim_config={
             'learning_rate': 1e-3,
           verbose=True,print_every=100)
   solver.train()
   best model = model
    END OF YOUR CODE
```

### 15 Test your model!

Run your best model on the validation and test sets. You should achieve above 50% accuracy on the validation set.

```
[21]: y_test_pred = np.argmax(best_model.loss(data['X_test']), axis=1)
    y_val_pred = np.argmax(best_model.loss(data['X_val']), axis=1)
    print('Validation set accuracy: ', (y_val_pred == data['y_val']).mean())
    print('Test set accuracy: ', (y_test_pred == data['y_test']).mean())

Validation set accuracy: 0.544
    Test set accuracy: 0.531

[]:
```
